

### GP 12

Overwintered green plants are the quickest way to produce a full crop. These are micro-propagated, virus-free plants thinned out in the greenhouse, hardened off in the open air and overwintered in the chiller. There are 60 plants in each plant culture tray. The best time to plant is in April. In optimum conditions, the plants can put out 3 - 5 roots, even in their first year, and can reach a height of up to two metres. They achieve close to their full yield even in the year after they are planted.

### GP 37

Virus-free green plants propagated in the year of planting. The plants are cultivated in 60-plant cultivation trays and hardened step by step before delivery. They are approx. 10 -15cm high. Planting should take place from the end of August to the end of September. After that, there is a risk of winter damage. Later planting is also possible in sheltered locations.

### Long Canes

In blackberries, the harvest period can be restricted in a similar way to strawberries by the use of "Long Canes". Long Canes are cultivated in 3.5 - 4.5l pots in the preceding year. Two roots are usually cultivated per pot, at a height of 1.60 to 1.80 m. In winter, these plants are stored and cooled to -1.5 °C. In the following year, they can be taken out of the cold store at the required time and then planted. Fruit will start to be harvested from 70 to 90 days after planting, depending on the date of planting.

#### Available varieties:

- LOCH TAY (s)
- SWEET ROYALLA®
- LOCH NESS
- ASTERINA® fruloche (s)
